Hot Air Sterilizer

Air is certainly the cheapest way to exchange heat with the medical devices to be sterilised. Hot air is the classic way to sterilise objects that may be damaged by steam, such as sharp instruments and glass items.

C.B.M. links tradition with the latest technology and the hygiene associated with stainless steel. The "Panacea" dry air sterilising units, which are immediately recognisable by their "stainless" design, guarantee the best sterilisation service thanks to the microprocessor control with P.I.D. system.

C.B.M. offers hot air sterilizing units for every need, from the hospital to the professional's surgery.
